© FORTINET

The diagram on this slide shows FortiManager-FortiGate interactions. As this slide shows, when you perform an installation from FortiManager to FortiGate, FortiGate creates a new revision history.

If you run a script on a device database or on a policy package, you must perform an installation on the managed devices.

If you run a script directly on a remote device, an automatic update occurs, creates a new revision, and updates the device-level database.

If you perform a retrieval from FortiManager, or an automatic update occurs, FortiManager creates a new revision history. If the changes are related to policies or objects, you *must* run the **Import Policy** wizard to import policies and objects into the ADOM database.
